Advanced research and development, innovative engineering, and integrated technologies enable the headphones to reduce unwanted noise and provide you with exceptional acoustic performance in a comfortable, convenient package. There are no cable connections required for this use.The maximum input voltage is 9 Vrms. To make the connection, insert the headphone plug into the jack on the audio source you will use. They rotate in one direction only. Note Incorrectly rotating the earcups can damage the headphones.However, you can simply wipe the outside surfaces with a damp cloth, as needed. Also, be sure that the earcup ports are clear and that no moisture is allowed into the earcups.It is engineered to withstand the altitude and temperature conditions common in noncommercial aircraft. Please help to establish notability by citing reliable secondary sources that are independent of the topic and provide significant coverage of it beyond a mere trivial mention. If notability cannot be established, the article is likely to be merged, redirected, or deleted.The circuit board was relocated from the headphone plug to midway up the cord. The MIE includes a microphone and remote control, located on the cord.When connected with a smartphone app, the earphones played soothing, ambient sounds to help mask exterior noises and relax the wearer. However, due to many complaints about poor battery life, Bose will no longer manufacture and sell the product. Bose is allowing customers to return the sleepbuds for a full refund, and gave an explanation on the official website as to why the earphones were being discontinued.Retrieved 20101225. Why Decades of Bose research combine with their Acoustic Noise Cancelling headphone technology to deliver the ultimate in audio performance. This awardwinning technology electronically identifies and reduces the unwanted noise around you on buses or trains, in the office, even at home. So you hear more of what you want to hear.Proprietary TriPort headphone technology also helps give you incredible headphone audio performance while keeping the design compact and streamlined. QuietComfort 2 headphones are lightweight and comfortable, and whether you take them on a trip or to the office, they will fold flat to store easily in a bag or briefcase. A single detachable audio cable gives you easy access to portable players, home stereos and inflight entertainment systems, all with less tangling than twocable designs. That same cable can be removed so your headphones can go cordless when you simply want the benefits of noise reduction Features Bose Acoustic Noise Cancelling headphone technology. Jake R 3.0 out of 5 stars The sound was incredible and they were perfect for the airplane. Unfortunately, after a couple years of use one of the headphones began to fall apart and they no longer played sound out of that ear. I have since recently upgraded to the new bluetooth Bose QuietComfort 35s and they are fantastic. My old QC 2 phones lasted for a VERY LONG time and I use them several times a day, every day. Hours and hours of service until they died of old age. Tried two other brands, neither of which could compare in any way to Bose. Did not want bluetooth as I am not that tech savvy; 67 years old and only use these with my Amazon Fire tablets and Zune and Sony mp3 players at home. These arrived in excellent condition much sooner than the expected delivery date. Great purchase for refurbished QC2 phones. Do not hesitate to buy these. When you wear these, you have heard your last baby crying on the 8 hour flight to Hawaii. And, if your husband ignores you when you call him and he has these on, he's not ignoring you. He really can't hear you. lol Works like a charm and cancels out most of the noise on the plane. I love the case that it comes in and the interior pocket stores the jacks conveniently. I used them every night now to stream on my Kindle so I don't have to hear the stomping and loud talk coming from the apartment above me.

They are also very comfortable for my ears. They came in very good condition. I tried to listen to a cheaper brand of noise cancelling headphones but it's hard to compare with Bose. I love Bose! They are the same price as my iPod and to be honest, I would rather have these with a CD player than an iPod with iPod ear buds. I can't stand ear buds. When I played music, I couldn't hear anything except for the music, which had amazing sound. The bass does not deteriorate like other headphones in the air. The flight was so nice, that when we landed, I didn't want to leave. The only thing that the QC2 don't cancel out is human voice, which is good. That way, you'll hear if the pilot announces that your flight is rerouted say to New Zealand. Just kidding. That was the way there. On the way back, some parents brought their 4 yr old son on board who, as you can imagine, was quite boisterous. Quite boisterous throughout the entire flight in fact. The headphones cancelled his crying. Thank God! When in the air listening to music, if I closed my eyes, it was like sitting in a house listening to an expensive speaker system. The Bose headphones are the most comfortable headphones I've ever worn. I can wear them for hours without getting a headache. I think next Bose should design airplane seats. Specs The QC2 has one microphone placed right by each of your ears that anticipate unwanted background noises, and transmits canceling waves. They also contain TriPort technology, which allows the headphones to reproduce low tones without adding weight to the headset. Also the headphones have a detachable cord which allows you to just use the headphones for noise cancellation without having to deal with a cord. The headphones come with an almost hard shell carrying case which includes a removable pouch, 2 human ear replicas to put the headphones around, a whole set of Bose courtesy cards for you to give out to possible customers, and an external pocket.

The headphones use 1 AAA battery which is supposed to last for 35 hrs of use. On the right cup of the headphones is a light indicator that is on when the headphones are on and flashes when the battery is going to last for about 15 minutes more. Pros Great sound, great noise cancellation, great

amount of comfort. Cons Price, the carrying case does not have a compartment to hold the detachable cord. Suggestion to customer Before I bought the QC2, I owned the Bose triport. These headphones have the same triport technologies that the QC2 has, and are almost equal in sound quality. They are great headphones that go for half the price of the QC2. What a waste of money. The AAA batteries last a long time in these headphones. It seems airplanes, these days, are less insulated from engine noise. These headphones do a lot to quiet that noise especially the low and mid frequencies and bring comfort while traveling. In addition to blocking the continuous white noise and engine hum, they perform nicely for music listening and movie watching. These headphones obviously can't block all undesired noises, but the significant amount that they do block is worth the investment. What these earphones do quite efficiently is remove the low-pitched monotonous hum that one hears in airplanes and cars. They will also reduce the noise from HVAC units. One thing I have not seen in any user review, but have read about elsewhere, is that because these earphones work by generating a soundwave that is 180 degrees out of sync with the one they are eliminating, there is a constant pressure on the eardrum that becomes slightly painful after 3 or so hours. Years ago I had one of the early noise cancelling headsets that did not exhibit this problem, perhaps because it had a large hole in the center of each earpiece to allow excess noise or counter noise to escape. Highly recommended. In order to navigate out of this carousel please use your heading shortcut key to navigate to the next or previous heading.

I will buy from this seller. I love my Bose QuietComfort headphones. Worth every single penny. I am wearing them now, and wear them at work every day so I can focus on my work and because, frankly, I don't want to hear other people's conversations, even about work. As much as I use them, at least 8 hours a day, 5 days a week, 50 weeks a year, I probably replace the pads once every 18 months or so. I'm so glad these are easy to replace, provide renewed soundproofing, and increase comfort around my ears. I also wear glasses, and have found the pads to be flexible enough to accommodate my glasses earpieces as well. I went on YouTube to watch someone else do the replacement first, and I'm glad I did. I probably would have touched one of the internal pieces that shouldn't be touched. Full review I bought my first BOSE product about 4 years ago, that is, a QC15 headphone. So I considered buying a new BOSE headphone, until a thought came to me that the earpads may be replaced. So I did some search online and found this product. This product literally saved my QC15. Thank you Senitek company. A big reason why I recommend it is that it is very very easy to install after you watched this video. Another big reason why I recommend it is that it is half 50% the price including shipping cost compared to the BOSE original replacement earpads for QC15. And as you may know, at the price of a set of Bose headphones, you don't just discard them due to a replaceable part deteriorating. I then went back to the internet and saw that you listed them. And you had a selection of different carriers and prices. I went with the ones that had the Bose brand name at the higher price, being leery of buying something that might not be up to my expectations. They arrived in a box with Bose logo and insert. And arrived three days before I expected them. I also liked the tracking system that. Band was very easy to zip up. Am so excited coz my headphones looked embarrassing. Wish I had taken a before photo!

Nothing will break. I was nervous to yank it off since there are no instructions but when I pulled it off I was relieved to see the headset can in no way break from pulling on the cushions. Once you figure out how to gently snap them under each one you're good. It saves both money and unnecessary waste by allowing the product to continue serving its purpose instead of sitting in a landfill. When the padding on my QC25s started to come unglued, there wasn't a question about replacing them. Other than some high-end canal phones I've had, the QC25 is the best headset I've ever used. When I was able to find Bose OEM replacements here and in the same color as my originals they immediately went into my shopping cart. Replacing them was not difficult. After reading the instructions, I snapped the old ones off, peeled off the old blue scrims and the tape they left behind, gave the phones a good wiping down and then reapplied the scrims and foam pads. The whole

operation took about 1015 minutes and when it was finished, my QC25s looked as good as I have Bose QC15 and QC25 headphones and I bought one pair of these for each set of headphones. They look exactly like the originals and appear to be of better quality. My original Bose ear cushions split at the seams and the foam was coming out. These don't look like they will do that as easily as the Bose ones did. So far very happy with these new ear cushions. I own two pairs of QC2s, and ruined one of the four replacement pads trying to push these pads down until they snapped and under the clips using a small metal tool usually used to disassemble snap together cases. This worked well, and the thicker backing on the replacement pads didn't crease and kept their shape once in place. For the record, these are not OEM parts from Bose. They are very close to the original ear cushions, but there are some differences.

Installation of the new cushions can be a bit confusing, as the foam ring that holds onto the clips can sometimes be finicky and they end up popping out of the clips when trying to fit them in. A little trial and error is all it takes. In the images below, the Accessory House is on the left, and the original is on the right. The right ear original cushion was still. I have updated my review of this product from 1 star to 4 stars. Although the product looked like an exact replacement, when compared to the Bose Earpads, aligning the inner discs that snap into the headpiece, top to top, sides to sides, they were exactly the same. The problem arose in the bottom inner ring of the earpad. This prevented the earpad from correctly snapping into the tabs by creating a bulge. I tried working the bulge around the headset but I could not get it to seat properly. Although the pads did not fit properly, I changed the rating from 1 star to 4 stars based on the excellent customer service. It was the care and rectification of the problem that impressed me.. full review Turns out I prefer these to the wireless over the ear Beats! I have owned QC15 predecessor to these headphones for about 3 years now, and have owned QC20 in ear headphones since they came out. My musical tastes are varied everything from Yiruma to Taylor Swift to Childish Gambino to Zedd. I listen at my desk at home, in the office, and on public transportation. Four things really mattered to me when I upgraded to the QC25 sound quality, noise cancelling, comfort, and the portability. So I'll skip aesthetics and the other features that you can easily read about. And I'll tackle each of those four critical points in this review, naming a winner in each category. Bose QuietComfort 35 II Review Top tier ANC headphones, even among the newer options. Just wait for them to go on sale.

You're already spending hundreds of dollars, might as well get one of the best headphones that Bose has to offer. Even when compared to newer models, these still hold their own. Now the company has the new Noise Cancelling 700 Headphones terrible name, I know, but before those came out the noise cancelling cans to beat were the QC35 Series II. So how do they hold up now that some time has passed. Are they worth your money over the newer models or even the competition Opening it up reveals the headphones nicely tucked away inside. It really shows just how flexible these headphones are. They're ready to be thrown in your bag without a second thought. Along with the headphones, you'll get a micro USB charging cable and a 3.5mm audio cable. It would've been nice for them to give the QuietComfort 35 II a USB-C charging port, but at least they still have a headphone jack. Everything about them was almost identical, save for a few key features. For one, the newer series II has an Action button that can be used as a dedicated Google Assistant button, allowing you to activate the Google Assistant seamlessly right from the headphones. Since the release, there's also been an update to make them compatible with Amazon Alexa as well, so if that's your personal assistant of choice then you're in luck. It's pretty nifty but in my testing, I basically either kept it on or off so I'm not sure how useful it is. Still, at least you have the option to control it if you want that extra bit of customization over how you listen to music. It's pretty cool, especially since the process is helped along by a small voice egging you along in your ear. After you select your language and pick a nickname you'll get to the Action button setup, which lets you choose between Google Assistant, Amazon Alexa, and an active noise cancellation toggle. You can ask your Google

Assistant questions through your headphones just like you would if you activated the assistant on your phone, except it's much quicker.

As soon as you press the button you'll hear a quick little tone and then you can ask your question or give your command. Normally with headphones, you'd have to wait a second or two for it to register and pull up Google on your phone, but with the Bose QuietComfort 35 II it starts listening as soon as you press the button so you're not left wondering if it worked or not. I'm assuming this is one of the benefits you get from working directly with Google and being one of the Made for Google products. If your smartphone has a native Google Assistant, you'll still be able to access it by holding down the multifunction button on the right earcup for a second. So you get the best of both worlds. In order to program the Action button to Google Assistant, you'll have to download the Google Assistant app on your iPhone. Additionally, if you select the ANC toggle for your Action button, you can access your smartphone's Siri by holding down the multifunction button. I had no problem with connection strength whether my phone was in my pocket or across the room. Extreme range testing aside, I only had three skips in regular usage over the course of about a week, so not bad at all. This solid connection strength applied to phone calls as well and I had no dropped calls or issues here. If call quality is important to you these won't let you down. On top of all that, when you turn them on they seamlessly connect almost AirPods like. Super quick. So everything else about these including the build quality, sound quality, and battery remains pretty much the same. But in case you missed our first review, we'll dig into each of these now. They maintain the slim profile of the original and also the comfort level as well. The Bose QuietComfort 35 II is considered one of the most comfortable pairs of headphones on the market, and for good reason. You can wear these for hours without ever feeling like you have to take them off to let your ears breathe.

They're also super durable and can be bent and twisted in a bunch of ways so if you have to jam them into your bag you can do so with a clear conscience. Besides the Action button and multifunction buttons we already mentioned, you'll get the volume up and volume down buttons as well as a power switch on the right earcup. You'll also see that these charge via micro USB on the bottom of one earcup and even have a 3.5mm input on the other so you can hardwire them to your phone, if your phone still has a headphone jack. That's enough to do a coast-to-coast flight across the United States three or four times. Not bad. In our testing, we got exactly 15 hours and 46 minutes on about 80% battery. So unless you play your music at max volume constantly you shouldn't have an issue with these. Even though as of Android Oreo, Android has LDAC, aptX, and aptX HD support for higher quality streaming via Bluetooth, you won't find any of those in the QC 35 II headphones. You need two to tango with these codecs so when one side of a connection doesn't support a codec, they default down to the standard SBC. The QC 35 II do support AAC thankfully, so iOS users will benefit, and you won't be stuck out in the rain when it comes to latency at least. Lack of high quality codecs doesn't mean these headphones are bad, the average person will probably find them more than great. Of course, you can always equalize your headphones to change things around to your tastes, but this kind of performance allows you to do that out of the box—like I said, really cool. Each bass kick in the song We Just Haven't Met Yet by Russ shook my eyes just a little bit, but that's probably more the result of the mixing than anything else. Mids are just as clean as they've always been with vocals coming through loud and clear. But one could always hope. These also do a great job at straying away from harshness, though at the detriment of the detail in the highs.

You won't get some of the same airiness and space that you'll notice when listening to openback headphones of a similar price. The hi-hats and cymbals in Billy Joel's Zanzibar sound a little flat and don't really have that exhilarating effect that I know them to have. That being said, it handles the voice band acceptably well, and will work for phone and conference calls just as well as could be expected. See how the lower in frequency you go, the quieter that response gets. If you have a particularly deep voice, you'll find that the microphone quality will struggle to pick up your voice's

fundamental tones, so it'll sound a bit weird—to say the least. However, most don't have much to worry about here. Bose has always had top of the line ANC, but it's starting to get a little behind the times. Though Shure left Bose in the rearview mirror with the AONIC 50, the Bose QuietComfort 35 II still offers top notch active noise cancellation. For commuters, this is super important, as noise reduction is the most important performance metric for active noise canceling headphones. That means that sounds in those frequencies will be almost 20dB lower. Pretty neat stuff! Some people claimed they began to sound worse, others claimed that the active noise cancelling wasn't as effective. So if you believe this has happened to you, there are some quick and easy steps you can take to confirm that the issue isn't the firmware. I know, this seems basic, but you'd be surprised how many technological bugs can be fixed with a simple reboot. If this doesn't work, continue on to the next steps. If you're still having issues, then it might be time to admit defeat and contact Bose customer support — or you can plumb the support topics page in Bose's YouTube channel. In many cases, Bose found that the difference was made by the ear pads not being fastened all the way.

While that may sound like a copout answer, it tracks with what we know as routine headphone testers how headphones fit matters a whole lot. Please refer to the video above for an official rundown on potential troubleshooting issues. These headphones are still arguably the best around and offer many things that the Bose headphones do not such as higher quality Bluetooth streaming codecs like LDAC and aptX. That said, it doesn't matter if you're on iOS as Apple doesn't support anything better than AAC on their devices. They also offer a slightly better microphone, a transparency mode feature similar to the AirPods Pro or WF1000XM3 if you want to hear what's going on around you, and most importantly, better active noise cancelling. We have an entire article comparing the two, but the long and short of it is that while the QC35 II are a great pair of headphones, the Sony WH1000XM3 are just slightly better. If you don't have a voice like Barry White, the Bose QuietComfort 35 II is probably better for calls than the Sony WH1000XM3 for you. Be sure to listen to the video above for a comparison. Cleverly named the Bose Noise Cancelling Headphones 700, they have a brand new design and a slightly higher price tag. So which is better The new design and sleek aesthetic is the most obvious difference, but besides that there isn't too much technically different between the two. The earcups are no longer made of the microfiber cloth here, which is a negative for me as I found the newer model to be slightly less comfortable because of this. Still, it really isn't a big deal and that's just me being nitpicky. The new model is still very comfortable, just not as comfortable. Besides that, you now have more control over the active noise cancelling levels. Where the QC35 II had three modes low, medium, high, the new Noise Cancelling Headphones 700 feature 11 different levels of ANC. Again, I mostly keep it either on or off, but if you want more control you have it here again.

It's also slightly better at cancelling outside noise than the QC35 II, so if that's what's driving your purchase decision then there's your answer. So if you're into touches and swipes instead of clicky buttons, these are for you. However, its little foibles and dated hardware make the Sony WH1000XM3 a compelling option in comparison. But you'll have to decide for yourself if it's better for you. The ANC is still one of the best you can get at any price point, and because nothing else about these has changed they're still just as amazingly comfortable as they were before. The music sounds fine, but what you're really paying for is all of the cool new features. The high price tag will definitely deter most people, but let's be real these are going to fly off the shelves anyway. If you were already going to buy the original Bose QuietComfort 35, there's really no reason not to get these. Of course, there are now better options available like the Sony WH1000XM3 and even the new Bose model of headphones, but both have their negatives as well. So if these just do it for you, then the Bose QC35 II are still a great pickup today especially if you can find them on sale. Still expensive, but your patience will save you a good amount of money. Now there are plenty of other options to choose from as well including a few from Sony. I already mentioned the Sony WH1000XM3 headphones but if you don't feel like spending that much money you can also go with

the Sony WHCH710N headphones which offer ANC as well as a great battery life. If you want a more bassheavy sound signature there's also the Sony WHXB900N and there's even great options from other companies like AKG and Shure. The AKG N700NC have excellent noise cancellation, and the Shure AONIC 50 have the strongest active noise cancelling we've ever tested. Explore our pick of the best Wireless Headphones Bose QC 35 II vs Microsoft Surface headphones Which is better. That is the decision you're making here. The Bose 700 is beautifully built and has a classy, ultramodern look, while the QC35 II remains a handsome model that offers the same shine factor but better portability. It's all about your preference. Bose 700 Image credit Toms Guide The 700 is constructed of sturdy stainless steel and softtouch plastic. Bose gave the extenders a very avantgarde design, placing them on the outside of the ear cups, although the track holding both pieces together feels flimsy. I appreciate the way the flattened buttons complement the cans sleek form. Although the ear cups do swivel so you can fit the headphones into the carrying case, they don't fold down for compact storage. Bose QuietComfort 35 II Image credit Regan Coule The QC35 II might not look as sexy as its successor, but it's still a fashionable set of headphones suited for business class. Its corrosionresistant stainless steel and glassfilled nylon are an upgrade from the plastic used on the firstgen version. Bose fans will also admire the reflective brand logo on each ear cup. More important, the QC35 II does fold down and is easier to stow away. The color options are one of the QC35 II's biggest strengths. The headphones are part of Bose's customization program, which allows owners to create their own colorway; the 700 has yet to be added to this program.
